TV Analyser

► PDP2

Where others are blind, HEXYLON keeps seeing. The exclusive Path Delay Profile patent feature allows to measure echoes without demodulating the signal up to 1.148μs.

► TS Analysis

Treeview of PSI/SI tables with content decoding.

► TS Recording

Allows to save and playback a sample of a TS (SPTS or MPTS) or T2-MI signal in the onboard **64Gb** storage.

► RF Recording

Catch any RF signal up to 25MHz bandwidth and save it for further analysis.

► T2-MI Analysis

Provides the reception of a T2-MI signal and its analysis: L1 signaling, L1 post-signalling, DVB-T2 timestamp, PLP, BB.

► Advanced Info

Exhaustive information about the modulation parameters.

► MER/Carrier

Find any interference in your channel, is invisible for a traditional spectral analysis and make decrease the quality of your signal.

► Alarms

Thanks to this feature that shows all the priority 1, 2, and 3 TS alarms generated by the Hexylon in a period of time selected by the user, you can detect any failure in the TS layer.

► Constellation

Constellation diagrams are an indispensable tool to help detect the presence of noise, phase jitter, interferences, and gain compression, all of which impact on the signal quality and thus reduce the Modulation Error Ratio (MER).

► Measurements

Access to all the measurements of the channel at any instant included in a range of time selected by the user.

► Services

This feature shows a bitrate distribution graph of the channel services, as well as all the information relative to them.

► Real Live 4K Video

Ultra HD signals real-time display.

Spectrum Analyser

► Fast and Accurate

With a sweeping time <10ms, and multiple RBW and VBW filters, the HEXYLON spectrum analyser allows a deep analysis of any signal between 5MHz and 3.3GHz.

► Trigger by Level

Catch any pulsed signal in your network using this feature, with trigger level defined by the user.

► Continuous Band

The entire band at a glance with the HEXYLON's continuous band spectrum. From 5MHz to 3.3GHz.

► Waterfall

The waterfall diagram is a three-dimensional representation of the signal spectrum, in frequency and time. Signal levels are converted to colors and displayed along a time axis, enabling the detection of the spurious interferences.

Radio Analyser

► PRS+Null Symbol

This feature shows two spectrum overlapped charts: one is the representation of the phase reference symbol (PRS), and the other one is the representation of the null symbol.

► DAB+ Parameters including TII

It shows exhaustive information about the modulation parameters, including the Transmitter Identification Information (TII).

► Radio Info

It shows all the information about the tuned channel. For FM channels it is shown the RDS information, and for DAB channels it is shown the Ensemble, the Service, and the Radiotext information.

► Echoes

This feature displays the echoes of the received. Level and distance information related to the main beam are shown.

▶ Errored FIB

This feature makes an errored fast info blocks (FIB) analysis of the fast info channel (FIC) during a time interval selected by the user.

▶ MER/Carrier

This feature represents MER value per each carrier of the DAB signal.

▶ FM Deviation

It shows the difference between an FM modulated frequency and the nominal carrier frequency.

▶ MPX Spectrum

This feature shows the spectrum of the demodulated FM signal, the FM channel measurements, and several deviation measurements: mono, stereo, pilot and RDS deviations.

The simplest way to get the highest benefit of your HEXYLON

► Web Application & Personal Cloud
